Background

Interferon regulatory factors (IRFs) comprise a family of transcription factors that function within the Jak/Stat pathway to regulate interferon (IFN) and IFN-inducible gene expression in response to viral infection. IRFs play an important role in pathogen defense, autoimmunity, lymphocyte development, cell growth, and susceptibility to transformation. Plays a role in regulating mammary epithelial cell proliferation (By similarity). May regulate WDR65 transcription.

Western blot analysis of IRF6 expression in Jurkat cell lysate.
